

Eco-friendly practices have been on the rise in the recent years with communities depicting knowledge on environmental conservation and awareness. However, there are still communities that are yet to realize the need for eco-friendly practices and the environment remains under threat due to destructive human endeavors. El Bolson in Argentina and Seaton, in Canada, are exemplary communities that have taken the initiative to demonstrate concern for the environment and its wellbeing.

Taking the Initiative

Most eco-friendly practices experienced in the modern context are usually initiated by either the government or the activists of environmental conservation. Companies, in their corporate responsibility initiatives, can also take the initiative to engage in environmental conservation endeavors as a way of ensuring the competitiveness of their firms. The implication is that few communities, if any, will start off the environmental conservation undertakings without the assistance from somewhere or someone. The community of El Bolson, however, is one among the few that have integrated environmental conservation practices in their day to day lives. Mobilization of the community is evidenced by the decision to lead environmentally friendly lives which entail sensitizing community members to be responsive, emotionally and physically, to the concerns of the environment in which they dwell. El Bolson practices are unique in that the location of this small city has received little attention with regard to environmental concerns despite their commitment in the same. Secondly, this community leads

life in distinct manners in comparison to the inhabitants of the US and Western Europe, a factor that may add new knowledge in dealing with the environmental problems. Third, the eco-friendly practices involved here are the initiatives of the locals and are, therefore, different from others that always await government's intervention (Tjørring, 2013).

Seaton, in Canada, is another community that demonstrates similar characteristics with El Bolson in matters environment. The ~~is~~ ^{Unclear} ~~is~~ ^{Tense} community took the initiative to plan the establishment of an eco-friendly community in north Pickering. This plan saw a developer go to court to challenge the move. The High and Supreme Courts ruled in the community's favor pointing out that the community's plan was final. The plan is expected to be the largest, most sophisticated, and important environmental conservation initiative in Canada. De Gasperis, the developer who had challenged the move, finally admitted that every other land in Seaton depicted more sensitivity to the environment as compared to his and, therefore, there was need for the plan to continue as per the court's decision and the wish of the community (Gombu, 2007).

The Benefits of Taking the Initiative

By taking the initiative in the environmental conservation matters, the El Bolson community has benefit from the creation of a collectivist culture where each individual gets involved in other community issues of concern (Tjørring, 2013). In Seaton, the mobilization of the community will attract the government's intervention, needed in starting off the environmental conservation project as hypothesized by the mayor of north Pickering (Gombu, 2007), more easily than if the community showed no concern in engaging in such an initiative.

Is this in the text?

The community's initiative in environmental concerns is a prerequisite in the modern context. While humans have always posed a major challenge by destroying the environment, time has come for them to act and react in a more eco-friendly manner to ensure the sustainability of the lands in which they dwell. El Bolson and Seaton are among the exemplary communities in this regard. Where the government intervention may be necessary at the start, it becomes easier with community mobilization than waiting for the government to take the initiative in planning such endeavors. The benefits go to the communities involved in the long run rather than the government.
